

Double sided LED based sign, designed around "push through" style letters. (the only part of the sign that illuminates are the letters. The sign is made of aluminum, and cnc routed letters on the face are lined with colored acrylic creating the glowing letter effect. The face of the sign is Castleton green, the sides are brushed aluminum.

2" tube steel brackets will be used to attach to building. For extra reinforcement, we are adding a third bracket to the center of the sign. The unit is engineered for a 110 MPH max windload. This is the standard used for FL and LA projects, and is overkill for VT.
